

SupportDesk AI — Feature List & Marks Weightage

Simple guide: what to build and how much each part is worth

Read this before you start coding. Total marks = 100. Build the high-marks items first.

A. CORE FEATURES (60 marks) — Build these first.

Non-negotiable.

These are the basic features every MERN app must have. Without these, the project does not work at all.

#	Feature	What it means (simple words)	Marks
1	User Login & Signup	People can create an account and log in safely. Passwords are hidden/encrypted, not stored as plain text.	8
2	Role-Based Access	Two types of users: Customer and Agent. A customer cannot see the agent's dashboard, and the other way around.	5
3	Create & View Tickets	Customer can raise a support ticket (a complaint or question). Agent can see all tickets in a list.	8
4	Update & Resolve Tickets	Agent can change ticket status (Open → In Progress → Resolved). Customer	6

#	Feature	What it means (simple words)	Marks
		can see the status change.	
5	Comments on Tickets	Customer and agent can chat back and forth on one ticket, like a comment section.	5
6	Search, Filter, Pagination	Agent can search tickets by keyword, filter by status/priority, and see them page by page (not all 500 at once).	5
7	File Upload	Customer can attach a screenshot or file to a ticket.	4
8	Real-Time Updates (Socket.io)	When something changes (new ticket, new comment), the other person sees it instantly — no need to refresh the page.	8
9	Form Validation & Error Handling	If someone fills the form wrong, the app shows a clear message instead of crashing.	5
10	Responsive Design	The app looks good and works properly on both mobile and laptop screens.	3
11	Deployment (Live Link)	The project is not just on your laptop — it is live on the internet,	3

#	Feature	What it means (simple words)	Marks
		and anyone can open the link and use it.	

Core Features Total: 60 marks

B. BONUS AI / VOICE FEATURES (30 marks) — Build at least 2.
This is what makes you different from other students.

Note: Admin dashboard stays fully manual (no AI). The agent does everything themselves — reads tickets, sets priority, assigns, replies. The AI lives only in the features below, mainly as a customer-facing chatbot. This keeps the project simpler and easier to finish in 6 days.

#	Feature	What it means (simple words)	Marks
12	AI Chatbot (GenAI Feature)	A chat widget on the customer side, powered by an LLM (Gemini/OpenAI/Mistral Ai). Customer types a question, chatbot replies using AI — can answer FAQs, explain how to raise a ticket, or have a normal conversation. This is your main GenAI feature.	10
13	Voice-to-Text	Instead of typing, the customer can speak into the mic (to the chatbot or the ticket form), and the app	8

#	Feature	What it means (simple words)	Marks
		converts speech to text automatically.	
14	Text-to-Voice + Call Agent (Twilio)	The chatbot's text reply is read out loud (text becomes voice). On top of that, a customer can request a phone callback — the system uses Twilio to actually call them, and a voice agent talks to them and logs what was said as a ticket.	12

Bonus Features Total: 30 marks

Simple Rule: GenAI = the AI only talks/answers (like this chatbot). Agentic = the AI takes an action by itself (like auto-resolving a ticket). Since you are keeping the admin side manual, you are doing the GenAI version, not the agentic version — that is a perfectly good and simpler choice. Just be able to say this clearly if asked in an interview: "I built a GenAI chatbot, not an autonomous agent — the agent (human) still makes the final decisions."

C. PRESENTATION & DOCUMENTATION (10 marks) — Do not skip this. Many students lose easy marks here.

#	Feature	What it means (simple words)	Marks
16	Clean GitHub Repo	Your code is organized in folders properly, with a <code>.gitignore</code> file, and multiple small	3

#	Feature	What it means (simple words)	Marks
		commits (not one giant "final" commit).	
17	README File	A document in your repo that explains what the project does, what tech you used, and how to run it.	3
18	Demo Video (2 minutes)	A short screen recording showing your project working — login, create ticket, AI feature, real-time update, everything.	4

Documentation Total: 10 marks

Grand Total: 100 Marks

Core Features → 60 marks

Bonus AI/Voice Features → 30 marks

Documentation & Demo → 10 marks

TOTAL → 100 marks

Simple Priority Order (if you are short on time)

1. Finish everything in Section A first (Core). This alone gets you 60 marks and a working app.

2. Then build **2 features minimum** from Section B (Bonus). Aim for the AI Chatbot + one more (Voice-to-Text is the easier second pick) — these two together already give strong "AI project" credibility.
3. Spend the last few hours on Section C (README + video). It only takes a few hours but many students forget it and lose easy marks.

Remember: A simple project that fully works is always better than a big project that is half-broken. Do not try to build all 4 bonus features if it means your core login/ticket system breaks.
